1. PROJECT OVERVIEW

This technical memorandum identifies the data and methodology used to complete a benefit cost analysis (BCA) for the Fayetteville – Person & Russell St. Bridge and Stream Restoration project. The project will mitigate stormwater flooding through bridge improvements, by stabilizing streambank erosion, and providing additional stormwater storage within the floodplain. These mitigation actions will reduce flooding of existing transportation assets, 505 structures, and provide nature-based stream enhancements for approximately 4,000 LF of Blounts Creek.

Benefits were captured as avoided losses from stormwater flooding and were quantified in dollar terms for the purposes of this BCA. The following methodology outlines the steps that were taken to calculate a BCA ratio of **2.27** with \$23,049,028 in total mitigation costs (including \$107,806 per year in maintenance) and \$52,238,793 in benefits.

1.1 Project Background

Fayetteville is the largest city in Cumberland County, North Carolina and is most notably home to Fort Bragg, a major U.S. Army installation. Strategically located in the Upper Coastal Plains section of North Carolina, it is distinctively known as the “Sandhills”. The incorporated area of the City of Fayetteville is approximately 148 square miles, however, approximately 54 square miles of the City consist of land within Fort Bragg. Since the area of Fort Bragg is excluded from local oversight, the remaining area of approximately 94 square miles falls under the authority of the City. This massive area contains complex natural and built water systems that both provide and control water flows throughout Fayetteville. As part of the City’s Municipal Separate Storm Sewer System (MS4), the stormwater system is composed of curbs, gutters, catch basins, culverts, pipes, and ditches that collect and convey stormwater for discharge to receiving streams. There are an estimated 576 miles of storm drainpipe and 22,115 catch basins and drop inlets located throughout Fayetteville.

Within the County, there are thirty dams forming lakes or ponds. Nearly 75,000 acres of the land within the County is in the 100-yr or 500-yr special flood hazard area. The geography and topography of the city makes this region particularly vulnerable to pluvial and, often, fluvial flooding. There are several significant natural flowing bodies of water including the Carver's Falls on Carver Creek- a tributary of the Cape Fear northeast of the city limits, as well as the Blount Creek which flows through Fayetteville into the Cape Fear River Basin and empties into the Atlantic Ocean. Although the natural alignment of many receiving streams has been altered over the past century, many of the stream banks remain mostly vegetated. Stream banks that were armored with riprap as a result of previous stream bank stabilization efforts are currently allowed to re-vegetate naturally. Because of this unique water system, much of the City is at risk of flooding due to extreme precipitation events and overtopping of local rivers, creeks, and streams. There is clear evidence that storm events are becoming stronger and happening more frequently, thus placing regions with extensive watersheds at increased risk of future flooding. Climate related changes are expected to bring warmer temperatures that are predicted to escalate the intensity of storm events, therefore pushing the City’s aging infrastructure to the brink and challenging its ability to reliably operate during extreme conditions. The proposed Russell Person St Bridge and Stream Improvement Project aims to prevent and mitigate against these future hazards, while also providing additional protection to the

various disadvantaged communities within the project area as well as low-lying portions of the city as a whole.

Fayetteville consists of diverse population of approximately 208,778 residents. While the County itself already scores relatively high on the CDC Social Vulnerability Index (SVI), the project area is primarily located within Census Tract 2 and 38 having SVI scores of 0.9977 and 0.9398 respectively, indicating that significant portions of the city's population is unable to adequately prepare for and respond to the stress of hazardous events including natural disasters. With nearly 19% of the total population at or below the poverty line and approximately 12% of the population identified as disabled, these are just some of populations that will be most affected by current flood hazards. Widespread flooding to residential homes, particularly in vulnerable locations, will continue to be a major threat if not addressed adequately.

The area being mitigated by the proposed project encompasses mixed residential, commercial, and industrial zoned properties at the eastern edge of Fayetteville between Person Street and Gillespie Street, along Blounts Creek, immediately west of the Cape Fear River as shown in Figure 1. As the City is expected to experience higher quantities of rain in shorter durations of time, new challenges will arise to test the City's stormwater management systems. This area specifically remains vulnerable to extreme precipitation events that cause overtopping of Blounts Creek and threaten residential, and non-residential structures, as well as several surface streets and a rail line. The urgency and necessity of upgrading existing infrastructure is critical to protecting and ensuring residential and commercial properties are resilient and can withstand these flood and climate change impacts.

Figure 1. Project Location

1.2 Proposed Mitigation Action

This project involves four primary components:

1. The replacement of the Person St. bridge over Blounts Creek with a longer bridge and roadway approaches. This will include providing a tie-in to the proposed roundabout project under design at the intersection of Old Wilmington St. and Person St.
2. The replacement of the Russell St. bridges (EB and WB) with a longer bridge and roadway approaches.
3. The replacement of the CSX railroad bridge that runs between the Russell St. bridges with a longer structure.
4. Stream enhancements for floodplain management and stream restoration along Blounts Creek for approximately 4000 feet starting approximately 300' downstream of the Person St. crossing and ending at the downstream side of South Cool Spring St.

The identified impacts of past and predicted flooding create stream erosion, disconnections of dwellings, traverse flooding of existing transportation networks, and adverse impacts to residents. The project will replace bridges that are nearing the end of their useful life, minimize future flooding, and improve the flood capacity and water quality along Blounts Creek.

2. FEMA GUIDANCE AND SOFTWARE

The following narrative provides the methodology used to obtain the Russell-Person St Bridge and Stream Improvement Project BCR. Following the FEMA BCA Reference Guide and Supplement, this analysis uses stormwater modeling and expected damages of statistical determinations of likely occurrence and associated damages during expected 5-, 10-, 25-, 50-, and 100-year events. The BCA for this project was primarily guided by FEMA's BCA Reference Guide and Supplement and the BCA Toolkit Version 6.0.

This project mitigates stormwater flooding to a variety of buildings and roadways. Therefore, the BCA Toolkit and this BCA Methodology document are set up to reflect the impacted structures. Mitigation Actions were added to the Toolkit based on impacted structure type, including roads, residences, and non-residential buildings. The number (map marker) and property type of each Mitigation Action in the Toolkit and its associated building(s) or roadway is shown in Table 1. The benefits from these ten Mitigation Actions are aggregated in the Toolkit to determine the overall project BCR.

Table 1. BCA Toolkit Setup Based on Structure Type

BCA Toolkit Mitigation Action Number	BCA Toolkit Property Type
1	Residential Building
2	Non-Residential Building

3. HISTORIC EVENTS

In accordance with the FEMA BCA Reference Guide and Supplement, expected loss data can be used to calculate benefits for the BCA. While frequent stormwater flooding has occurred annually at the site, there is insufficient documentation of these flood events to use historic damages as the basis of this BCA. Therefore, expected damages were calculated based on engineering models. Project engineers provided H&H and stormwater modeling that calculated the extent and depth of flooding for the 5-, 10-, 25-, 50-,

and 100-year rainfall events, based on topography, drainage, and storm sewer capacity in the area. This stormwater model was used to determine the impacts associated with each expected flood event.

4. PROJECT AND MAINTENANCE COSTS

The total project and annual maintenance costs for implementing the proposed mitigation project is provided in Table 2 below. Maintenance costs for the project were calculated as \$107,806 per year. These costs include maintenance activities for both the grey and green infrastructure elements of this project.

The proposed project cost is \$21,561,225. Additional information on maintenance costs and activities, and the line-item construction costs can be found in the full project application.

Table 2. Mitigation Project and Maintenance Costs

Mitigation Activity	Project Cost	Annual Maintenance Cost
Russell-Person St Bridge and Stream Improvement Project	\$21,561,225	\$107,806

5. PROJECT USEFUL LIFE

According to the FEMA BCA Reference Guide – Project Useful Life Table (**Appendix B**), a design life of 50 years should be applied for drainage systems, roads, and bridges. As such, a useful life of 50 years was used for the City of Fayetteville drainage improvement mitigation measures in the BCA Toolkit.

6. STORMWATER MODELING

This section contains information on the engineer-provided stormwater model that determined inundation area and flood depths for the 5-, 10-, 25-, 50-, and 100-year rainfall events. Flood extent and depths provided the basis for identifying impacted structures and calculating losses associated with each expected event.

HEC-HMS [MS1] software was utilized to calculate runoff values for the 24-hour design rainfall events using meteorologic data obtained from NOAA Atlas 14, Vol 2, Ver 3. The outputs included runoffs for the 2-year, 5-year, 10-year, 25-year, 50-year, and 100-year at key locations. The runoffs at the key locations were utilized to create the steady flow data for the hydraulic model in HEC-RAS software. The existing conditions hydraulic model was created, using both surveyed and lidar data as well as existing models, to determine both the magnitude of the existing flooding and the potential factors that exacerbate existing flooding. The results of the existing model were used to create rasters using RASMapper to show the buildings, roads, and land currently impacted by flooding of Blounts Creek. Observing the existing model, several proposed models were created addressing situations that were deemed to play a significant role in the existing flooding of Blounts Creek. Rasters were created from the proposed model results and compared to the existing rasters to see the impact each solution had on flooding issues. Of the multiple proposed solutions, it was determined that addressing the lack of flow area under the Russell and Persons bridges and the lack of flow area and storage between Persons and S. Cool Springs would provide the greatest impact to the existing flooding situation.

6.3 Level of Protection

The proposed project provides a 5-foot reduction in flood elevation just upstream of the Russell St. bridge during the 100-year event and as much as a 3-foot reduction for the 25-year event. These flood reductions translate to 270 structures being removed from risk during the 100-year event and significant reductions in risk for the 235 remaining impacted structures.

7. PHYSICAL DAMAGES

Direct physical damages include the degradation and destruction of property due to flood inundation that would occur should this project not take place. FEMA categorizes property loss as both structural damage (i.e., damage that applies to real property or buildings) and contents damage (i.e., damage to personal property or inventory). Analysts evaluated these losses at various flood depths for input into the BCA Toolkit. The following steps describe the analysis used to determine building and content losses for the buildings in the project area.

7.1 Data Sources

BCA analysts utilized the following data sources to calculate expected structure and contents losses avoided through this mitigation project:

- **Cumberland County Building Footprints (2022):** The building footprint data provided on Cumberland County Open Data website, represents the perimeter extent of buildings, and includes number of stories for most structures. Where stories were not provided a single story structure was assumed. Analysts created a project-specific structure ID, which is a unique number assigned to each building and used as the basis of analysis.
- **City of Fayetteville, NC Parcel Boundaries (2022):** Parcel data maintained by Cumberland County published in March 2022 on <http://data.nconemap.gov> was used to attribute structure uses and addresses to building footprints.
- **RSMeans Replacement Cost Values (2021):** Analysts determined total building replacement values (BRVs) using standard values provided in the Hazus technical manual table 14.6. These values provided in 2021 dollars were adjusted for inflation to 2022 dollars using the BLS CPI Inflation calculator
- **FEMA Contents-to-Structure Ratio Values (CSRVs):** The 2011 FEMA BCA Reference Guide Supplement provides CSRVs based on building type, in the form of a percentage of BRV (Appendix E). This guidance states that when generic DDFs from USACE are used, 100% of the BRV can be used for residential structures.
- **FEMA Depth Damage Functions:** US Army Corps of Engineers (USACE) Generic Riverine Depth Damage Functions (DDFs) for residential and non-residential structures were used to determine the amount of damage to buildings and contents for each flood scenario. The DDFs were chosen based on the hazard and structure type of each building. DDFs used can be found in Appendix G.
- **Hazus Occupancy Classes:** Hazus is a nationally applicable standardized methodology that contains models for estimating potential losses from earthquakes, floods, and hurricanes and is used for structure occupancy classes for applying appropriate DDFs and replacement values.

7.2 Develop Asset Inventory

Analysts identified benefitting structures (e.g., the structures within the project area that are expected to be impacted by the 5-, 10-, 25-, 50, or 100--year rain events) and gathered building attributes necessary for examination, such as number of stories, total area, and building use, from building and parcel data, summarized in Table 3.

Table 3. Building and Parcel Attributes

Attribute	Analysis Use
Number of Floors	Used to apply DDFs and to estimate replacement values
Ground Elevation	Calculated as the minimum ground elevation within the building footprint, used to estimate flood depth for each event
Footprint area	Used as an estimate of the first-floor square footage
Building Area	Footprint area multiplied by number of floors, used to estimate replacement values
Use Code	Describes building use, mapped to Hazus occupancy classes
Basement Flag	Indicated the presence of a basement, assumed to be False for all buildings in the project area; used to apply DDFs

7.3 Determine Critical Flood Elevations

Mean ground elevation was determined for each structure using a LiDAR generated Digital Elevation Model (DEM). In the absence of data supporting the presence of basements for structures all structures were conservatively assumed to not have basements. Therefore to determine critical flood elevations for each structure mean ground elevation of the building footprint plus an 18-inche assumption for foundation height was used to determine critical flood elevations.

7.4 Building and Contents Replacement Values

Analysts determined building and contents replacement costs using standard RS Means 2021 replacement cost values provided in table 14.6 of the Hzus Technical Manual. The BRV per SF for each occupancy class can be found in Table 6. Fayetteville-specific use codes were mapped to occupancy classes as shown in Appendix F. Once the per-square foot values for structures was determined, these values were multiplied by the first-floor area to determine BRV.

Contents replacement value (CRV) is typically expressed as a percentage of BRV. To calculate the CRV, analysts multiplied the first-floor BRV by the CSV, as determined by the BCA Toolkit Version 6.0. For residential properties, CRV is 100% of BRV.

Table 4. BRV and CRV Values, RS Means 2021

Occupancy Class	Definition	Local BRV per SF (2021)	CSVR
COM1	Retail Trade	\$116.51	1
COM2	Wholesale Trade	\$107.09	1
COM3	Personal and Repair Services	\$144.30	1
COM4	Business/Professional/Technical Services	\$188.14	1
COM8	Entertainment and Recreation	\$240.42	1
COM10	Parking (Garages)	\$61.65	0.5
EDU1	Schools/Libraries	\$280.99	1
IND1	Heavy Industrial	\$124.47	1.5
IND2	Light Industrial	\$107.09	1.5
REL1	Church/Membership Organizations/Non-Profit	\$195.38	1
RES1x1	SF Dwelling 1-story	\$271.03	1
RES1x2	SF Dwelling 2-story	\$127.11	1
RES3B	Triplex/Quads	\$258.70	1

7.5 Determine Flood Depths

To determine the flood depths, analysts subtracted the grade elevation from the flood elevation at each structure. This calculation yielded the flood depth per building per recurrence interval that was needed for input into Depth Damage Functions to determine the level of damage caused by each event.

7.6 Depth Damage Functions

Once BCA analysts established the expected flood depths at each building, US Army Corps of Engineers (USACE) Generic Riverine Depth Damage Functions (DDFs) were applied to determine the amount of damage to buildings and contents for each flood scenario. The DDFs were chosen based on the hazard and structure type of each building. All DDFs used in the analysis are included in Appendix G. This percentage is applied to a structure’s BRV or CRV to produce a physical loss value in dollars, which was entered into the BCA Toolkit for each flood scenario.

7.7 Results

The relationship between flood depth and damage to buildings and contents provided by the DDFs were used to calculate the dollar value of physical damages associated with the 5-, 10-, 25-, 50-, and 100-year rainfall events before and after mitigation. These total losses for buildings and contents are shown in Table 5 below for pre-mitigation, and in Table 6 below for post-mitigation. These values were entered directly into the BCA Toolkit. Appendix H contains a detailed spreadsheet of these calculations.

Table 5. Building and Contents Damages, Before Mitigation

Recurrence Interval	Residential Building Damages	Residential Contents Damages	Commercial Building Damages	Commercial Contents Damages
5	\$704,078.91	\$400,102.65	\$-	\$-
10	\$1,982,057.99	\$1,125,792.08	\$424,963.83	\$819,143.89
25	\$6,576,053.66	\$3,741,898.15	\$8,645,009.38	\$18,527,158.67
50	\$13,441,892.49	\$9,701,635.13	\$18,146,904.31	\$38,214,271.38
100	\$18,820,127.57	\$14,832,735.26	\$26,566,303.21	\$56,009,691.79

Table 6. Building and Contents Damages, After Mitigation

Recurrence Interval	Residential Building Damages	Residential Contents Damages	Commercial Building Damages	Commercial Contents Damages
5	\$486,183.70	\$277,507.33	\$-	\$-
10	\$1,302,987.45	\$731,251.10	\$66,664.71	\$109,112.02
25	\$2,639,764.95	\$1,488,223.00	\$4,626,643.73	\$10,216,722.66
50	\$3,931,566.30	\$2,214,878.32	\$7,396,989.24	\$16,745,504.20
100	\$6,815,830.46	\$3,865,771.05	\$12,264,180.91	\$27,606,378.94

8. DISPLACEMENT COSTS

8.1 Data Sources

Residents of impacted structures may experience displacement costs during the time when a building becomes uninhabitable due to flood damage. Commercial relocation costs are associated with moving a business to a new location and resuming business in that new location. Residential relocation costs are associated with the temporary relocation to a hotel and are based on per-diem costs for lodging, meals, and incidentals. Relocation costs are derived from displacement time, which is obtained from DDFs that relate a depth of flooding to an amount of time a structure is not usable. BCA analysts used the following data sources when evaluating displacement costs:

- Hazus-MH 3.2 Default One-time and Daily Disruption Costs:** Hazus provides national one-time and daily relocation costs per square foot based on Hazus occupancy class. These costs were provided in 2006 dollars and have been escalated to 2021 dollars based on inflation.

- **American Community Survey:** The American Community Survey (ACS) from the Census Bureau provides block group-level population and housing counts, using the 2011 5-year estimates (Appendix L). These counts were distributed to residential buildings within a block group, scaling based on total square footage of residential buildings. For instance, if a block group with 500 people had 2 residential buildings, one with a total area (including all floors) of 2,000 square feet and a second with 3,000 square feet, the first building would be assigned a scaled population of 200, while the second would be assigned 300 residents.
- **2020 FEMA BCA Standard Economic Value Methodology Report:** FEMA recommends a value of \$7 per person per day (in 2021 dollars) to represent the cost of food at home.
- **US General Services Administration:** Per recommendations from the 2021 FEMA BCA Standard Economic Value Methodology Report, per-diem lodging and meals and incidental expenses (M&IE) values for the project area were pulled from the US General Services Administration. Values for Cumberland County were averaged, across all months provided for FY21, resulting in a per-diem lodging cost of \$118 and M&IE cost of \$64.00.
- **Flood Depth:** Flood impacts were modelled for different flood scenarios to determine which structures are expected to flood and the depth of flooding within the structure (see Section 7).
- **Bureau of Labor Statistics Consumer Price Index Inflation Calculator:** The Consumer Price Index (CPI) is a measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services. The CPI Calculator was used to escalate the default one-time and daily disruption costs from Hazus.

8.2 Approach

The following approach was used to calculate displacement costs for all events before mitigation.

1. **Identify Impacted Structures:** The direct physical damages analysis identified structures expected to be impacted for each of the flood events. The impacted structures were those that had at least 10% of their building footprint within the floodplain of the event.
2. **Identify Impacted Square Footage:** The total impacted square footage is the area of the ground floor of the building. This value was determined in the physical damages analysis by taking the total building area provided by the assessor database and dividing it by the total number of floors.
3. **Evaluate Displacement Time:** The estimated flood depth within each structure is correlated to USACE depth displacement tables to estimate displacement time in days for each modeled flood scenario.
4. **Calculate One-Time and Daily Displacement Costs:** For commercial buildings, analysts used the Hazus standard values for one-time (\$/sf) and daily (\$/sf/day) displacement costs based on Hazus occupancy class to calculate the total displacement costs for each structure (Table 7). The Hazus values were multiplied by each building's first-floor area and for the daily value and by the number of days of displacement (from USACE DDFs). The one-time and daily displacement values were added together to calculate the total commercial displacement costs. Total displacement costs then equal:

$$\begin{aligned}
 & \text{Commercial Displacement Costs} \\
 & = \text{living area (sf)} \\
 & \times [\text{national rental cost (\$ per sf per day)} \\
 & \times \text{displacement time (days)} \\
 & + \text{local one time disruption cost (\$ per sf)}]
 \end{aligned}$$

Table 7. Displacement Costs by Hazus Occupancy Class

Occupancy Class	National One-time Disruption Cost per SF (2021)	Monthly Rental Cost per Day per SF (2021)
COM1	\$1.45	\$1.61
COM2	\$1.26	\$0.67
COM4	\$1.26	\$1.89
COM7	\$1.80	\$1.89
EDU1	\$1.26	\$1.42
IND2	\$1.26	\$0.38

For residential buildings, analysts followed the methodology outlined in the 2020 FEMA BCA Standard Economic Value Methodology Report, indicating that displacement costs should represent the per-diem cost of lodging and M&IE, minus the cost of food at home, for the duration of displacement. The census data in each tract was scaled to the structural buildings total square footage to determine the size of each household. These values were then used to determine the number of days in a hotel, making the total residential displacement costs equal:

$$\begin{aligned}
 & \text{Residential Displacement Costs} \\
 & = \text{Displacement Time (days)} \times \{ \text{Number of Households} \\
 & \times \text{Per Diem Lodging (\$ per day)} \\
 & + \text{Number of Residents} \\
 & \times [\text{Per Diem M\&EI (\$ per day per person)} \\
 & - \text{Cost of Food at home (\$ per day per person)}] \}
 \end{aligned}$$

8.3 Results

Table 8 shows the before mitigation results for displacement costs avoided aggregated for the residential and commercial structures, and Table 9 shows the results for after mitigation.

Table 8: Total Displacement Costs, Before Mitigation

Recurrence Interval	Total Displacement Costs Residential	Total Displacement Costs Commercial
5	\$170,072.46	\$-

10	\$650,704.66	\$4,795.62
25	\$2,555,920.53	\$429,569.73
50	\$7,396,333.15	\$990,411.95
100	\$12,444,161.97	\$1,411,475.79

Table 9: Total Displacement Costs, After Mitigation

Recurrence Interval	Total Displacement Costs Residential	Total Displacement Costs Commercial
5	\$117,182.08	\$-
10	\$452,972.13	\$4,788.22
25	\$1,050,354.73	\$266,323.43
50	\$1,585,818.85	\$439,389.42
100	\$2,756,734.64	\$581,525.46

9. ONE-TIME BENEFITS

11.1 Social Benefits

FEMA has determined that social benefits are eligible for projects that protect residential buildings, and therefore social benefits are included for residential structures in this BCA. As the project will reduce flood impacts to homes and apartment buildings, it will also reduce risks of mental stress and anxiety post-disaster. An economic value can be determined by completing inputs into the Toolkit. Analysts entered values for the number of residents and how many of those residents work into the Toolkit, which calculated a one-time value for expected annual social benefits.

As mentioned in Section 8.1, to determine the number of residents and workers in the project area, Analysts obtained population count and labor status data from the ACS 2021 5-year estimates for each block group in the project area. Counts of residents and workers were distributed to residential buildings within a block group, scaling based on total square footage of residential buildings.

The number of residents and the number who work were entered into the BCA Toolkit, and a one-time value for total expected annual social benefits of \$58,183,412 was calculated.

Table 10. Calculation of Social Benefits

Building	Number of Residents	Number of Residents Who Work	Economic Value of Social Benefits
Total Residents	1,570	1,245	\$14,711,830

11.2 Ecosystem Services Benefits

Ecosystem service benefits accrue when land use is changed or enhanced by a mitigation activity to provide a higher level of natural benefits. To determine the economic value for five land use types, FEMA developed a series of four ecosystem services categories and 19 subcategories that are applicable to hazard mitigation projects. BCA Toolkit users need to only enter the area that will be mitigated and select from the available land use types, and the Toolkit will use the FEMA-developed economic values to calculate the value of expected annual ecosystem services benefits.

This project will result in the stream enhancement and constructing additional green infrastructure on Person St enhancing riparian habitat. Therefore, BCA analysts included the area of stream enhancement and green space added by the green infrastructure to the Ecosystem Services section of the Toolkit. The values entered and resulting expected annual ecosystem services benefits are shown in Table 11 below.

Table 11. BCA Toolkit Calculation of Ecosystem Services Benefits

Ecosystem Services Field	Value
Total Project Area	13.01 acres
Green Open Space	7%
Expected Annual Ecosystem Services Benefits	\$33,877

10. RESULTS

The benefit-cost ratio for the project is listed in Table 12 below and represents the aggregated BCR for this project. Costs provided in the determination of the BCR include maintenance costs over the project useful life of the mitigation project. The total project BCR at the standard 7% discount rate is **2.27**, which demonstrates that the mitigation project is a cost-effective solution. In line with the October 6, 2022 Alternative Cost-Effectiveness Methodology for Fiscal Year 2022 BRIC and FMA Application Cycle Memorandum, this project also qualifies for use of the 3% discount rate based on primarily benefiting Census Tracts with CDC SVI scores greater than 0.6. Again, this alternative discount rate supports cost effectiveness with a BCR of **3.48**. The BCA Report is provided in Appendix A and the BCA Excel Spreadsheet is attached to the project application.

Table 12. Russell-Person St Bridge and Stream Improvement Project Benefit-Cost Ratio

Description	Benefits	Costs	BCR
Russell-Person St Bridge and Stream Improvement Project (7% Discount Rate)	\$52,238,793	\$23,049,028	2.27
Russell-Person St Bridge and Stream Improvement Project (3% Discount Rate)	\$84,676,156	\$24,355,048	3.48

Property Configuration

Property Title: Drainage Improvement @ Fayetteville, North Carolina

Property Location: 28301, Cumberland, North Carolina

Property Coordinates: 35.05534, -78.87727

Hazard Type: Riverine Flood

Mitigation Action Type: Drainage Improvement

Property Type: Residential Building

Analysis Method Type: Professional Expected Damages

Cost Estimation
 Drainage Improvement @ Fayetteville, North Carolina

Project Useful Life (years): 50

Project Cost: \$21,561,225

Number of Maintenance Years: 50 Use Default:Yes

Annual Maintenance Cost: \$107,806

Damage Analysis Parameters - Damage Frequency Assessment
 Drainage Improvement @ Fayetteville, North Carolina

Year of Analysis was Conducted: 2022

Year Property was Built: 0

Analysis Duration: 10 Use Default:Yes

2009 FEMA BCA Reference Guide, Contents Replacement Values

General FEMA Standard Values

Full Data Modules		
Data Type	Value	
Discount Rate	7%	
Building Damage (percentage) that would Result in Demolition	Non-Historic Buildings: 50% Historical Buildings: 50% to 90%	
Contents Value	50% of the Total BRV for Residential structures; non-residential vary based on the primary use of the building. <i>100% of BRV with Residential and Generic DDF tables from USACE – All the USACE curves labeled “Generic” give 100%; others range from 50–78%</i>	
Displacement Costs	\$1.44/square foot/month	
Subapplicants may use higher values for Displacement and Relocation Costs for commercial/residential buildings with proper documentation.		
Building Type for Flood Modules		
1 Story without a Basement	1 or 2 Story with a Basement	
Split Level without a Basement	Split Level with a Basement	
2 Story without a Basement	Mobile Home	
	Other	
Six of the listed building types have FEMA default DDFs associated with them that appear in Level Two of the Full Data module. When a building type is selected, it sets the FEMA default curves in the Level Two Data. By selecting “Other,” the FEMA default values are set to zero and the subapplicant must provide supported user-entered depth damage curves.		
Casualties and Injuries		
Dollar Values for Avoided Casualties	Injury Severity Level	Value
	Dead – Fatal	\$5,800,000
	Hospitalized	\$1,088,000
	Treat & Release	\$90,000
	Self-Treatment	\$12,000

Physical Damage and Displacement Cost Calculations

Flood Risk Calculator Summary

The Flood Risk Calculator (FRC) brings together a comprehensive list of existing methodologies across FEMA's Hazus, Flood Assessment Structure Tool (FAST), and Benefit-Cost Analysis (BCA) Toolkit models, as well as the USACE's Generation II Coastal Risk Model (G2CRM) and Hydrologic Engineering Center Flood Damage Reduction Analysis (HEC-FDA) model. The FRC's adaptability allows us to keep up with the most recent industry standards and gives us the flexibility to meet various client needs by adapting which modules within the FRC are run for each project. This tool currently evaluates the site-specific and collective impacts of individual flood events, bigger-picture sea level rise impacts, annualized flood risk, and present value risk within project areas ranging from small neighborhoods to large metropolitan regions. The FRC estimates direct physical damages to buildings and contents, direct business interruption, human impacts including casualties and shelter needs, direct loss of public services, and displacement and relocation costs for populations and businesses exposed to flooding. This tool also exports data to model indirect business interruption using a separate program called IMPLAN.

The FRC has evolved out of a spreadsheet model built by the Urban and Coastal Resilience Practice at Arcadis that captured building-specific damages using Hazus, FEMA BCA, and other federally aligned methodologies for up to four individual flood events. This spreadsheet model was limited in its computational capacity and was cumbersome (at best) for modeling moderate-sized project areas (~1,500 buildings). Furthermore, given the nature of a spreadsheet model, errors were easily propagated, and quality control was time-consuming and unsustainable. Over time, the desire to model larger, more complex projects prompted the team to develop a smarter, automated tool that could quickly evaluate a wide range of damage parameters over large project areas (the tool has been used for the 800,000+ building inventory in NYC), large numbers of distinct flood events (over 30 unique flood events in San Francisco), and also process those results to produce annualized and present-value risk.

This document aims to describe the inputs, methodologies, and outputs of the FRC, as used in BCAs supporting federal funding applications. For these applications, analysts typically only calculate direct physical damages and relocation costs, so methodology for other damage metrics is not included in this documentation.

Inputs

Inputs to the FRC are in the form of several tabular and geospatial datasets, along with some additional constants, currently stored in ESRI feature class and Excel workbook formats. Constants that are required to perform calculations in the FRC include the cost of food at home (\$7 per day, per the FEMA Benefit-Cost Analysis Sustainment and Enhancements, Standard Economic Value Methodology Report, 2020), the per-diem cost of meals and incidental expenditures (\$79 per person per day for Philadelphia, per the US General Services Administration), and the per-diem cost of lodging (\$184.42 per household per day for Philadelphia, per the US General Services Administration).

Table 1 summarizes the schema of the FRC input tables; primary keys of each table are **bolded**, and foreign keys (used to link tables together) are *italicized*.

Table 1. FRC Input Schema

Table Name	Column Name	Notes	Example Building Attributes	
			Residential	Commercial
Structure Inventory	Structure ID	Assigned by analysts	BCID_0019056	BCID_0014529
	<i>Census ID</i>	Link to Census Data	<i>421010156001</i>	421010141001
	Address	Not directly used in the FRC, but useful reference	523 W OXFORD ST	901-15 W GIRARD AVE
	Zip Code	Not directly used in the FRC, but useful reference	19122	19123
	<i>Structure Use Code</i>	Link to Structure Use Lookup	<i>O50</i>	MD0
	Number of Floors	-	4	3
	Footprint Area	Units: Square Feet	1,050	22,372
	Basement Flag	Binary flag indicating if the building has a basement	TRUE	1

Table Name	Column Name	Notes	Example Building Attributes	
			Residential	Commercial
	Critical Flood Elevation	Typically equal to the first floor elevation, or one foot above the ground elevation; Units: Feet	30.9	44.1
	Total Square Footage	Units: Square Feet; Inputted if known, calculated if not	4,199	67,117
Structure Use Lookup	Structure Use Code	Typically pulled from local assessor database	O50	MD0
	Structure Use Definition	Description of the structure Use Code	ROW 3 STY MASONRY	SHOPPING CENTER STRIP
	<i>Occupancy Class - Lower Floors</i>	Link to Standard Value Data	<i>RES1</i>	COM1
	<i>Occupancy Class - Upper Floors</i>	Link to Standard Value Data	<i>RES1</i>	COM1
	Mixed Use Flag	Binary flag indicating if the building is mixed-use	FALSE	FALSE
	Reporting Category	Useful for summarizing results	Single Family	Commercial
	Freshwater DDF	Used in conjunction with Basement Flag to assign Depth-Damage Function	Residential	Retail-Clothing
Census Data	Census ID	Typically represents unique ID for Census Block or Block Group	421010156001	421010141001
	Population	Units: Persons	811	1,600
	Housing	Units: Housing units	364	691
	Population in Labor Force	Units: Persons	476	618
Standard Value Data	Occupancy Class	Typically pulled from HAZUS standard occupancy classes	RES1	COM1

Table Name	Column Name	Notes	Example Building Attributes	
			Residential	Commercial
	Definition	Description of the Occupancy Class	Single Family Dwelling	Retail Trade
	Building Replacement Value (BRV) per Square Foot	Typical Source: RSMean or HAZUS standard values	\$271.03	\$178.56
	Contents to Structure Value Ratio	Typical Source: HAZUS standard values; Used to calculate Contents Replacement Value (CRV); $CRV = BRV * CSV$	1	1
	Annual Rent per Square Foot	Typical Source: LoopNet or HAZUS standard values	\$11.34	\$19.35
	Percent Owner Occupied	Typical Source: HAZUS standard values	75%	55%
	One-Time Disruption Cost per Square Foot	Typical Source: HAZUS standard values	\$0	\$1.45
Flood Elevation	Structure ID	-	BCID_0019056	BCID_0014529
	* Elevation for each flood event evaluated	Typically represents the maximum water surface elevation within the building footprint; Units: Feet	31.25	44.77
Floodplain Flag	Structure ID	-	BCID_0019056	BCID_0014529
	* Flag for each flood event evaluated	Binary flag indicating if building is in the floodplain	TRUE	TRUE
Structure DDF	DDFID	Standardized, unique identifier for DDFs compiled from multiple USACE and FEMA sources	R2WB	RETC

Table Name	Column Name	Notes	Example Building Attributes	
			Residential	Commercial
	* Flood depths ranging from -8 to 16 feet	-	17.9%	11.4%
Contents DDF	DDFID	Standardized, unique identifier for DDFs compiled from multiple USACE and FEMA sources	R2WB	RETC
	* Flood depths ranging from -8 to 16 feet	-	11.9%	29.0%
Displacement DDF	DDFID	Standardized, unique identifier for DDFs compiled from multiple USACE and FEMA sources	R2WB	RETC
	* Flood depths ranging from -8 to 16 feet	Units: Days	45	90

Intermediates

The FRC reads the input tables and constants, and first performs some intermediate steps to assign depth-damage functions to each building, estimate the square footage breakdown within the building, and distribute data from a census unit to each residential building in the unit. Intermediate processes are performed for every building in a project area and provide intermediate outputs that are used in later damage estimates for each flood event.

Assign Depth-Damage Function

Depth-damage functions (DDFs) are assigned to buildings based on a combination of attributes in the *Structure Inventory* and *Structure Use Lookup* tables. The FRC has two primary methods for assigning DDFs based on the DDF source, but it is possible to customize the DDF assignment for a given project area.

For typical funding applications, the US Army Corps of Engineers (USACE) Generic Riverine Depth Damage Functions (USACE Generic) for residential and non-residential structures are used to determine the amount of damage to buildings and contents for each flood scenario. The assignment of non-residential DDFs is linked to each structure use code in the *Structure Use Lookup* table, but residential DDFs are also dependent on the number of stories and the basement flag, as shown in Table 2. The FRC reads the relevant building attributes and assigns the appropriate depth-damage function for each building.

Table 2. USACE Generic Residential Structure and Contents DDF Assignment

Number of Floors	Basement Flag	Residential DDF
1	True	1-Story Residential with Basement
1	False	1-Story Residential without Basement
> 1	True	2-Story Residential with Basement
> 1	False	2-Story Residential without Basement

There are only two unique USACE Generic DDFs for displacement time: one for residential buildings and one for commercial buildings. Typically, high-rise buildings are assigned the commercial DDF, regardless of whether its use code is commercial or residential.

Each DDF has an attribute describing the maximum number of floors for which the curve is applicable. For instance, Generic USACE DDFs for non-residential buildings are typically only applicable to the replacement value of the first floor, while NACCS high-rise DDFs are only applicable for the first ten floors of a building.

The buildings referenced in Table 1, BCID_0019056 and BCID_0014529, use the “2-Story Residential with Basement” and “Retail-Clothing” DDFs, respectively.

Square Footage Analysis

Many calculations in the FRC are based on applying standard values to the square footage of each building to get building-specific values, such as the building replacement value (BRV) or contents replacement value (CRV), or

to distribute data at other geographical scales, like census data. Additionally, many buildings have multiple use types, and values should only be distributed to a portion of the building. For these reasons, the FRC breaks down a building’s square footage in 11 different ways, as summarized in Table 3, with example data from the buildings referenced in Table 1 (BCID_0019056 and BCID_0014529).

Table 3. Breakdown of Square Footage Attributes

Square Footage Attribute	Description	Calculated Values	
		Residential	Commercial
Theoretical Maximum	The product of the footprint area and the number of floors	4,199	67,117
Total	Minimum of either the inputted total square footage or theoretical maximum square footage; ensures data quality of inputted values	4,199	67,117
Single Floor	The total square footage divided by the number of floors	1,050	22,372
Lower Floors	For high-rise buildings (typically buildings over 6 stories), area of the two bottom floors (single floor square footage multiplied by two); for low-rise buildings, area of the bottom floor only (equal to the single floor square footage)	1,050	22,372
Upper Floors	Difference between the total square footage and the lower floors square footage	3,149	44,745
Residential Lower Floors	Equal to the lower floors square footage if the lower floors are residential, otherwise 0	1,050	0
Residential Upper Floors	Equal to the upper floors square footage if the upper floors are residential, otherwise 0	3,149	0
Total Residential	Sum of the residential lower floors and residential upper floors square footage	4,199	0
Adjusted Total	Product of the single floor square footage and the maximum number of floors for which a DDF is applicable	2,100	22,372
Adjusted Lower Floors	Minimum of the lower floors square footage and the adjusted total square footage	1,050	22,372
Adjusted Upper Floors	Difference between the adjusted square footage and the adjusted lower floors square footage	1,050	0

Distribute Census Data

The FRC disaggregates population and housing counts at the census unit (block, block group, or tract) level to each building within the census unit by weighting the distribution of population by the total residential square footage of each building. For instance, if a block group with 500 people had 2 residential buildings, one with a total area (including all floors) of 2,000 square feet and a second with 3,000 square feet, the first building would be assigned a scaled population of 200, while the second would be assigned 300 residents. Any commercial buildings in the block group would have assigned population and housing counts of 0.

To accomplish this, values at the census unit level are divided by the total residential square footage for all buildings within that census unit to produce population and housing counts per square footage, as shown in Table 4 for Census ID 421010156001, which had a total residential square footage of 840,339 across 277 residential buildings.

Table 4. Example Census Distribution

Attribute	Count	Value per 1,000 SF
Population	811	0.965
Housing Units	364	0.433
Population in the Labor Force	476	0.566

Applying Standard Values

Once square footage, population, and housing breakdowns are calculated for each building, the FRC applies relevant constants and standard values to the appropriate square footage breakdowns for use in damage calculations. Rental values for commercial structures are split between “Daily Owner Rent” and “Daily Rental Income” based on the “Percent Owner Occupied” attribute in the *Standard Value Data* table; Daily Owner Rent is equal to the product of the daily rent per square foot (derived from the annual rent per square foot by dividing by 365) and the percent owner occupied, while Daily Rental Income represents the product of daily rent per square foot and the percent *renter* occupied (equal to 1 minus the percent owner occupied). Table 4 summarizes the application of standard values, using example data from the buildings referenced in Table 1 (BCID_0019056 and BCID_0014529).

Table 5. Application of Standard Values

Square Footage Attribute	Standard Value	Intermediate Output Field	Calculated Values	
			Residential	Commercial
Adjusted Lower Floors	BRV per Square Foot – Lower Floors	Adjusted BRV	\$569,070	\$3,994,823

Square Footage Attribute	Standard Value	Intermediate Output Field	Calculated Values	
			Residential	Commercial
Adjusted Upper Floors	BRV per Square Foot – Upper Floors			
Adjusted Lower Floors	CRV per Square Foot – Lower Floors	Adjusted CRV	\$569,070	\$3,994,823
Adjusted Upper Floors	CRV per Square Foot – Upper Floors			
Adjusted Lower Floors	BRV per Square Foot – Lower Floors	Total BRV	\$1,138,141	\$11,984,471
Adjusted Upper Floors	BRV per Square Foot – Upper Floors			
Adjusted Lower Floors	CRV per Square Foot – Lower Floors	Total CRV	\$1,138,141	\$11,984,471
Adjusted Upper Floors	CRV per Square Foot – Upper Floors			
Lower Floors	Daily Rent per Square Foot – Lower Floors Percent Owner Occupied – Lower Floors	Daily Owner Rent	0	\$1,957
Upper Floors	Daily Rent per Square Foot – Upper Floors Percent Owner Occupied – Lower Floors			
Lower Floors	Daily Rent per Square Foot – Lower Floors Percent Renter Occupied – Lower Floors	Daily Rental Income	0	\$1,601
Upper Floors	Daily Rent per Square Foot – Upper Floors Percent Renter Occupied – Lower Floors			
Lower Floors	One-Time Disruption Cost per Square Foot – Lower Floors	Potential One-Time Disruption Cost	0	\$97,320
Upper Floors	One-Time Disruption Cost per Square Foot – Upper Floors			

For residential buildings, the FRC applies inputted per-diem constants to the product of the total residential square footage values for each building and the per-square-foot population attributes calculated in the census distribution step described earlier. The total per-diem relocation costs for each building are equal to the costs of lodging plus the difference between the cost of meals and incidental expenditures and the cost of food at home, summarized in Table 6 for the residential building referenced in Table 1 (BCID_0019056).

Table 6. Residential Per-Diem Cost Breakdown

Population Attribute	Standard/Distributed Values	Calculated Values
Population per Square Foot	Per-Diem Cost of Food at Home	-\$28.37
Population per Square Foot	Per-Diem Cost of Meals and Incidental Expenditures	\$320.16
Households per Square Foot	Per-Diem Cost of Lodging	\$335.45
Total Per-Diem Relocation Costs		\$627.24

Damage Metrics

This section details how the FRC iterates through inputted flood events to estimate flood depths, direct physical damages, and relocation costs for each building. Additional metrics, such as direct business interruption, can also be calculated with the FRC, but are not typically included in BCAs for federal funding applications, and are thus not included in this document.

Flood Depth

Because flood depth rasters tend to have high variability across a building footprint, the FRC calculates the flood depth for each building as the difference between the water surface elevation for a given flood event (usually inputted as the maximum water surface elevation across the building footprint) and the critical flood elevation (typically assumed to be the first floor elevation, or one foot above the average ground elevation for buildings on slab foundations).

For the example buildings BCID_0019056 and BCID_0014529, the calculated flood depths are **0.36 feet** and **0.46 feet**, respectively, for the 100-year, pre-mitigation flood event.

Direct Physical Damage

Direct physical damage represents impacts to a building's structure (known as Building Damage) as well as to its contents and inventory (summarized in the Contents Damage metric). The FRC estimates direct physical damage by interpolating the damage percentages from the DDFs for the calculated flood depth and multiplying it by the adjusted BRV or CRV, as appropriate. Interpolated values for the example buildings are shown in Table 7, resulting in damage values summarized in Table 8 for the 100-year, pre-mitigation flood event.

Table 7. DDF Interpolation for Direct Physical Damage Metrics

Structure ID	DDF	Depth (ft)	Building Damage Percentage	Contents Damage Percentage
BCID_0019056	2-Story Residential with Basement	0	17.9%	11.9%
		0.36	19.5%	12.6%
		1	22.3%	13.8%
BCID_0014529	Retail-Clothing	0	0.0%	0.0%
		0.46	5.2%	13.3%
		1	11.4%	29.0%

Table 8. Direct Physical Damage Results

Structure ID	Building Damage	Contents Damage
BCID_0019056	\$110,841	\$71,596

Structure ID	Building Damage	Contents Damage
BCID_0014529	\$207,303	\$528,675

Relocation Costs

Like the process for direct physical damages, relocation costs (also called displacement costs) start by interpolating the Displacement DDFs based on the flood depth at each building, as shown in Table 9.

Table 9. DDF Interpolation for Relocation Costs

Structure ID	DDF	Depth (ft)	Displacement Time (Days)
BCID_0019056	2-Story Residential with Basement	0	0
		0.36	16.2
		1	45
BCID_0014529	Retail-Clothing	0	0
		0.46	20.7
		1	45

For residential buildings, the FRC follows the methodology outlined in the 2020 FEMA BCA Standard Economic Value Methodology Report, indicating that relocation costs should represent the per-diem cost of lodging and M&IE, minus the cost of food at home, for the duration of displacement, as shown in Equation 1, and simplified in Equation 2 to match the variable derived in Table 6. The total residential relocation costs for example building BCID_0019056 is **\$10,119**.

Equation 1: Residential Relocation Costs

Residential Relocation Costs

$$\begin{aligned}
 &= \text{Displacement Time (days)} \\
 &\quad * \{ \text{Number of Households} * \text{Per Diem Lodging (\$ per day)} \\
 &\quad + \text{Number of Residents} \\
 &\quad * [\text{Per Diem M\&EI (\$ per day per person)} \\
 &\quad - \text{Cost of Food at home (\$ per day per person)}] \}
 \end{aligned}$$

Equation 2. Simplified Residential Relocation Costs

Residential Relocation Costs

$$= \text{Displacement Time (days)} * \text{Total PerDiem Relocation Costs}$$

For commercial buildings, the FRC follows the standard Hazus methodology, where the relocation costs are equal to the sum of the owner rental losses, rental income losses, and one-time disruption costs, as summarized in Equation 3. Commercial relocation costs are only incurred if the flood depth is greater than 1 foot, which assumes that businesses with less flooding may incur business interruption costs but will not be forced to relocate their business. For this reason, the example commercial building with the ID BCID_0014529 incurs no relocation costs.

Equation 3. Commercial Relocation Costs

Commercial Relocation Costs

$$\begin{aligned} &= \text{Displacement Time (days)} * [\text{Daily Owner Rent} + \text{Daily Renter Income}] \\ &+ \text{Potential OneTime Disruption Costs} \end{aligned}$$
